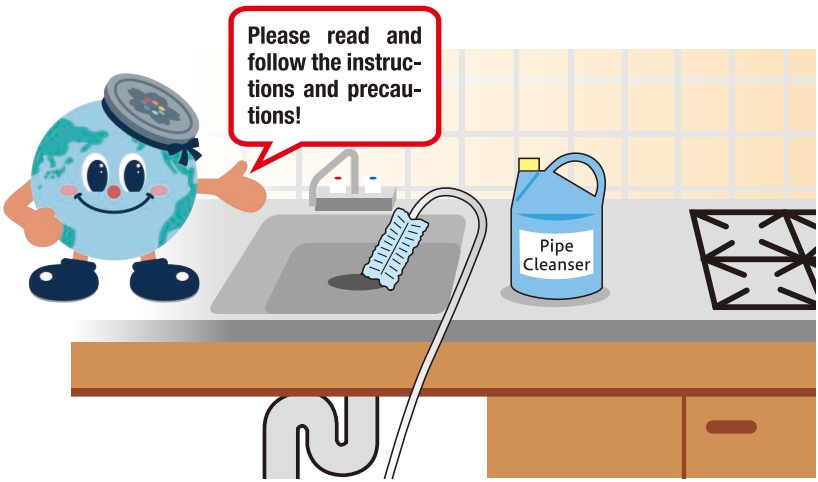
Q16 What should I do if the water is draining slowly or not at all?

A16 Please use cleaning utensils and cleansers intended for drainpipes.

Frequent testing and cleaning is an effective way to prevent drain troubles and make your drainpipes last for a long time.
However, some chlorine-based pipe cleansers can damage your drainpipes if used in excess (not just chlorine-based ones but, any cleansers can damage sewage pipes and contaminate rivers and oceans if used in excess). Please carefully read the instructions and precautions written on the cleanser bottle before using it.



Please contact an Everything Drainage Consultation Center for inquires related to pipe testing and cleaning (p.25)
